Registrar API

Agent - 2023-09-05 - Miscellaneous tech

In March 2020, we launched a new Registrar API. This Registrar API does not in any way replace the EPP or registrar web, but should be seen as a supplement in cases where the EPP protocol or registrar web is less suitable to use or where support is lacking. The registrar website already offers an opportunity to get this type of information, but it can be difficult to automate continuous reconciliation.

What can be done via our Registrar API right now are the following:

- Download a list of your own domains and filter out domains in that list. For example, search for expired domains or domains that expire within x number of days
- Download an invoice specification for a specific invoice
- Download a list of domains that will soon be released

You can find complete documentation of the API on the following page:
