Can a registrant change an IP address on a registrar's nameserver?

Agent - 2022-07-08 - Handling nameservers

Only the registrar who administers the underlying domain name can update the IP address for a host object. For example, the registrar who administers the domain *example.se* can update the host object *ns.example.se*

If it concerns a host object ending with another suffix than *.se* or *.nu*, the host object cannot be updated, it is then managed by Registry Services.
